

## **OBSERVING GEODYNAMIC SIGNAL FROM GRACE DATA**

Olivier De Viron, M. Diament, I. Panet, V. Mikhailov

Institut de Physique du Globe, Paris

The GRACE satellites have been orbiting the Earth for more than three years, which is barely enough to separate long term signal from the annual. We analyzed those data in order to find signature of geodynamics processes in the gravity signal. We show that a careful processing allows extracting the vertical ground displacement in several active areas. We apply this method to the Sumatra event.
