Motivation

Is the rupture process scale-invariant?

HELMHOLTZ CENTRE POTSDAM GFZ GERMAN RESEARCH CENTRE FOR GEOSCIENCES

Scaling relations

ECGS Workshop 2012

European Center for Geodynamics and Seismology

Seismic moment – corner frequency ("Static") EQs release same stress per unit fault area regardless of scale

$$\Delta \sigma \approx C \left(\frac{M_0}{\tilde{L}^3} \right)$$

Radiated Energy – Seismic moment ("Dynamic")

EQs radiate same energy per unit fault area per unit fault slip regardless of scale

$$\sigma_a = \mu \frac{E_0}{M_0}$$

European Center for Geodynamics and Seismology

Breakdown in scaling relations

- Scaling relations generally accepted for larger seismic events
- Debate over the scaling breakdown for smaller earthquakes controversial
 - Changes in rupture process between larger and smaller earthquakes (e.g. different rupture velocity, different governing physics)
 - Inappropriate corrections (e.g. for attenuation)
 - Invalid model assumptions (constant rupture velocity, certain failure mode)
 - Instrument-related (limited frequency band of the sensors)
 - Inappropriate data selection

European Center for Geodynamics and Seismology

Our data... from small- to femtoearthquakes

			Displacement		Seismic
Magnitude range	Class	Length scale	scale	Frequency scale	moment*
8–10	Great	100–1,000 km	4–40 m	0.001–0.1 Hz	1 KAk–1 MAk
6–8	Large	10–100 km	0.4–4 m	0.01–1 Hz	1 Ak–1 KAk
4–6	Moderate	1–10 km	4–40 cm	0.1–10 Hz	1 mAk–1 Ak
2–4	Small	0.1–1 km	4–40 mm	1–100 Hz	1 μAk–1 mAk
0–2	Micro**	10–100 m	0.4–4 mm	10–1,000 Hz	1 nAk–1 μAk
-2-0	Nano	1–10 m	40–400 µm	0.1–10 kHz	1 pAk–1 nAk
−4 to −2	Pico	0.1–1 m	4–40 μm	1–100 kHz	1 fAk–1 pAk
6 to4	Femto	1–10 cm	0.4–4 μm	10–1,000 kHz	1 aAk–1 fAk
-8 to -6	Atto	1–10 mm	0.04–0.4 μm	1-100 MHz	1 tAk–1 aAk

ECGS Workshop 2012, Luxembourg, October 3-5, 2012

European Center for Geodynamics and Seismology

Berlín Geothermal field

^{• 12 3}C borehole sensors used

- 581 events analyzed
- Interesting study to see how attenuation affects the scaling relations

Kwiatek et al., 2012, Special issue of Geothermics(submitted)

ECGS Workshop 2012, Luxembourg, October 3-5, 2012

European Center for Geodynamics and Seismology

Source parameters using spectral fitting

• Inversion for seismic moment, source radius and attenuation

European Center for Geodynamics and Seismology

Source parameters using spectral fitting

• Trade-off between source radius and quality factor resulted in problems with interpretation of results (broad scatter of $\Delta\sigma$)

HELMHOLTZ CENTRE POTSDAM GFZ GERMAN RESEARCH CENTRE FOR GEOSCIENCES

Kwiatek et al., 2012, Special issue of Geothermics (submitted)

ECGS Workshop 2012, Luxembourg, October 3-5, 2012

Spectral ratio method

- Applied to clusters of data (similar location and travel paths from EQ to receiver)
- Propagation effects effectively supressed by forming spectral ratios

$$\Psi^{ij}(f) = \frac{\dot{u}^{i}(f)}{\dot{u}^{j}(f)} = \frac{M_{0}^{i}}{M_{0}^{j}} \left(\frac{1 + \left(\frac{f}{f_{c}^{j}} \right)^{4}}{1 + \left(\frac{f}{f_{c}^{i}} \right)^{4}} \right)^{0.5}$$

ECGS Workshop 2012, Luxembourg, October 3-5, 2012

European Center for Geodynamics and Seismology

Source parameters using spectral ratio refinement

- Strong improvements in the quality of source parameters
- Trade-off between Q and F₀ responsible for scaling problems

Kwiatek et al., 2012, Special issue of Geothermics(submitted)

ECGS Workshop 2012, Luxembourg, October 3-5, 2012

European Center for Geodynamics and Seismology

Volcanic-hybrid EQs

- Analyzed 6073 events related to spine extrusion at Mt. St. Helens (data Sep 2006)
- Source parameters of >500 events calculated using the spectral ratio technique.

[See next talk by R. M. Harrington!]

Harrington et al., (in prep.)

ECGS Workshop 2012, Luxembourg, October 3-5, 2012

European Center for Geodynamics and Seismology

Volcanic-hybrid EQs

- Spectral fitting and spectral ratio method applied to 8 families
- \bullet Constant $\Delta\sigma$ observed for events originating from similar locations
- Velocity inhomogeneities influences observed stress drops

European Center for Geodynamics and Seismology

JAGUARS project: scaling of picoseismicity

- Mponeng deep gold mine, underground in-situ geomechanical laboratory
- Aim: Investigate the rupture process from nano- to picoscale (m cm source size)

European Center for Geodynamics and Seismology

JAGUARS project: scaling of picoseismicity

- Source parameters calculated for two types of data (M_W -4.1 to -0.8)
- Analysis: Spectral fitting / spectral ratio

Davidsen et al., 2012, PRL 108; Kwiatek et al., 2011, BSSA 100 (3); Kwiatek et al., 2011, BSSA 101 (6)

European Center for Geodynamics and Seismology

JAGUARS project: scaling of picoseismicity

• Earthquake rupture process governed by similar physics over a range of magnitudes (-0.8 and -4.1): supported by G-R relations, dynamic and static source parameters and statistical analysis of magnitude clustering and interevent time intervals.

ECGS Workshop 2012, Luxembourg, October 3-5, 2012

European Center for Geodynamics and Seismology

Slow rupture processes, $\Delta\sigma~\&~\sigma_{\rm a}$ dependendent on local geology

- Low rupture velocities: low P-to-S corner frequency ratio (Collins&Young, BSSA 1990), low radiation efficiency (Brodsky & Kanamori 2004)
- Local variations in $\Delta\sigma$ and σ_a clearly depend on geological setup (~V_R)

European Center for Geodynamics and Seismology

Non-DC components in nano/picoscale

- Low E_s/E_P ratio observed possible non-DC rupture processes
- P-wave energy cannot be ignored while estimating radiated energy

Kwiatek and Ben-Zion, in prep.; Kwiatek & Ben-Zion, proc. EGU2012

European Center for Geodynamics and Seismology

- Scaling relations in laboratory experiments
- Fractures < 1mm (expected magnitude M < -6)
- Challenge: AE sensors not calibrated in absolute sense, coupling issues
- Only relative methods apply for source parameters estimation

European Center for Geodynamics and Seismology

Static scaling for compaction band experiment

- Investigated 5 clusters of AE activity in a compaction band (116-212 events)
- Spectral ratio inversion used

Summary

- Spectral ratio method applied to a few datasets including natural, mining- and fluid-induced seismicity and AE data
- No scaling breakdown observed down to at least M_w -4.1

Summary

• Apparent breakdown of self-similarity due to insufficient attenuation corrections

(Mt. St. Helens, Berlin Geothermal Field, JAGUARS project)

- Evidences for slow rupture process (JAGUARS, Rudna Copper Mine)
- Local rock properties affect scaling relations (e.g. stress drop / apparent stress)

(~rupture velocity, JAGUARS project)

 Non-DC components affect radiation pattern. Need to account for radiated energy from P phases while calculating the total energy

(JAGUARS project)
